

GREAT ONOSETALE OJIETOHAMEN

Software Engineer and Security Researcher

greateojies@gmail.com | github.com/G-ojies | linkedin.com/in/greateojietohamen | greateojies.onrender.com | Benin City, Nigeria

PROFILE

Software engineer and security researcher who ships systems end to end and then takes other people's apart. More than twenty open-source projects across Solana, Sui and Bitcoin, alongside documented findings filed against live protocols and SDKs. Writes code and reports for reviewers: reproducible, honest about their limits, and still working on a low-end phone and a weak connection.

EXPERIENCE

Independent Software Engineer and Security Researcher

GreYat Labs, self-directed, Remote

- Designed and published more than twenty open-source projects across on-chain infrastructure, applied AI and data tooling, every one of them public on GitHub.
- Built role-based access control as a Solana program in Rust and Anchor, every record a PDA and every guard enforced by the runtime, and submitted it to the Solana Foundation Nigeria grant programme as a budgeted three-milestone proposal.
- Ran independent security reviews of third-party codebases and delivered structured findings reports: sixteen defects in a Rust confidential-computing SDK, eight in an agent-orchestration framework, and a mainnet fund-loss review of a privacy pool. Every finding carried a reproduction, an impact assessment and a suggested fix.
- Shipped a Solana transaction stack over Yellowstone gRPC with Jito bundle submission, reconnect under exponential backoff, and bounded-queue backpressure.
- Implemented a 2-of-3 FROST threshold Bitcoin wallet producing BIP-340 signatures, covering distributed key generation, share verification and aggregation.
- Contributed two reviewed plugins to an open-source AI agent runtime and diagnosed a silent interface-version mismatch that had been stopping plugins loading on the host.

Founder and Developer

GreYat Study Guide, University of Benin

- Built and deployed a free, offline-first progressive web application of worked past-question guides for six university courses, drawn from lecturers' own materials.
- Engineered full offline capability and installable delivery, so it stays usable through power and network outages on low-specification devices, and turned unstructured course material into flashcards, a three-state revision tracker and condensed revision sheets.

Researcher and Author

Data Science for Medical Laboratory Science

- Compiled and published an open learning library connecting data science to laboratory informatics, quality-control statistics, method validation and the clinical validation of predictive models.
- Verified every citation by automated link checking: 150 sources audited, 139 machine verified and the rest confirmed by hand, with the methodology documented so it can be rerun.

Freelance Web Developer

Remote and self-employed

- Designed, built and maintained responsive, search-optimised, security-hardened sites for small businesses and personal brands, owning requirements, delivery and maintenance.

SELECTED PROJECTS

FrostVault. BTC-collateralised lending on Sui in Move, liquidated through Deepbook.

BREACH. AI-native hacking game on OG: targets and adjudication both run on decentralised inference.

ChainSentry. Bitcoin forensics that walks output addresses N hops deep with loop detection.

Sharp Signal. Odds agent on the live TxODDS feed, proving each signal on Solana before it acts.

EDUCATION

B.Sc. Computer Science, University of Benin, Nigeria

Coursework: artificial intelligence, algorithms and data structures, data management, computer networks, discrete structures.

CERTIFICATIONS

Cybersecurity Certification, ICSI, United Kingdom | IT Support, Cybersecurity and Technical Foundations, Google, four certificates | Front-End Development, Meta | Bitcoin for Developers I, Saylor Academy, graded 100%

TECHNICAL SKILLS

Languages. Rust, TypeScript and JavaScript, Python, C++, Move, SQL, HTML and CSS

On-chain. Solana and Anchor, Sui and Move, Bitcoin (BIP-340, FROST, SPV), Solidity, Foundry, Hardhat

Web and systems. React, Next.js, Node.js, Tailwind, PostgreSQL, SQLite, Docker, Linux, Git and GitHub

Practice. Security review and findings reporting, applied AI and LLM integration, data pipelines, technical writing
